

Deep Generative Models: Linear Dynamical Systems

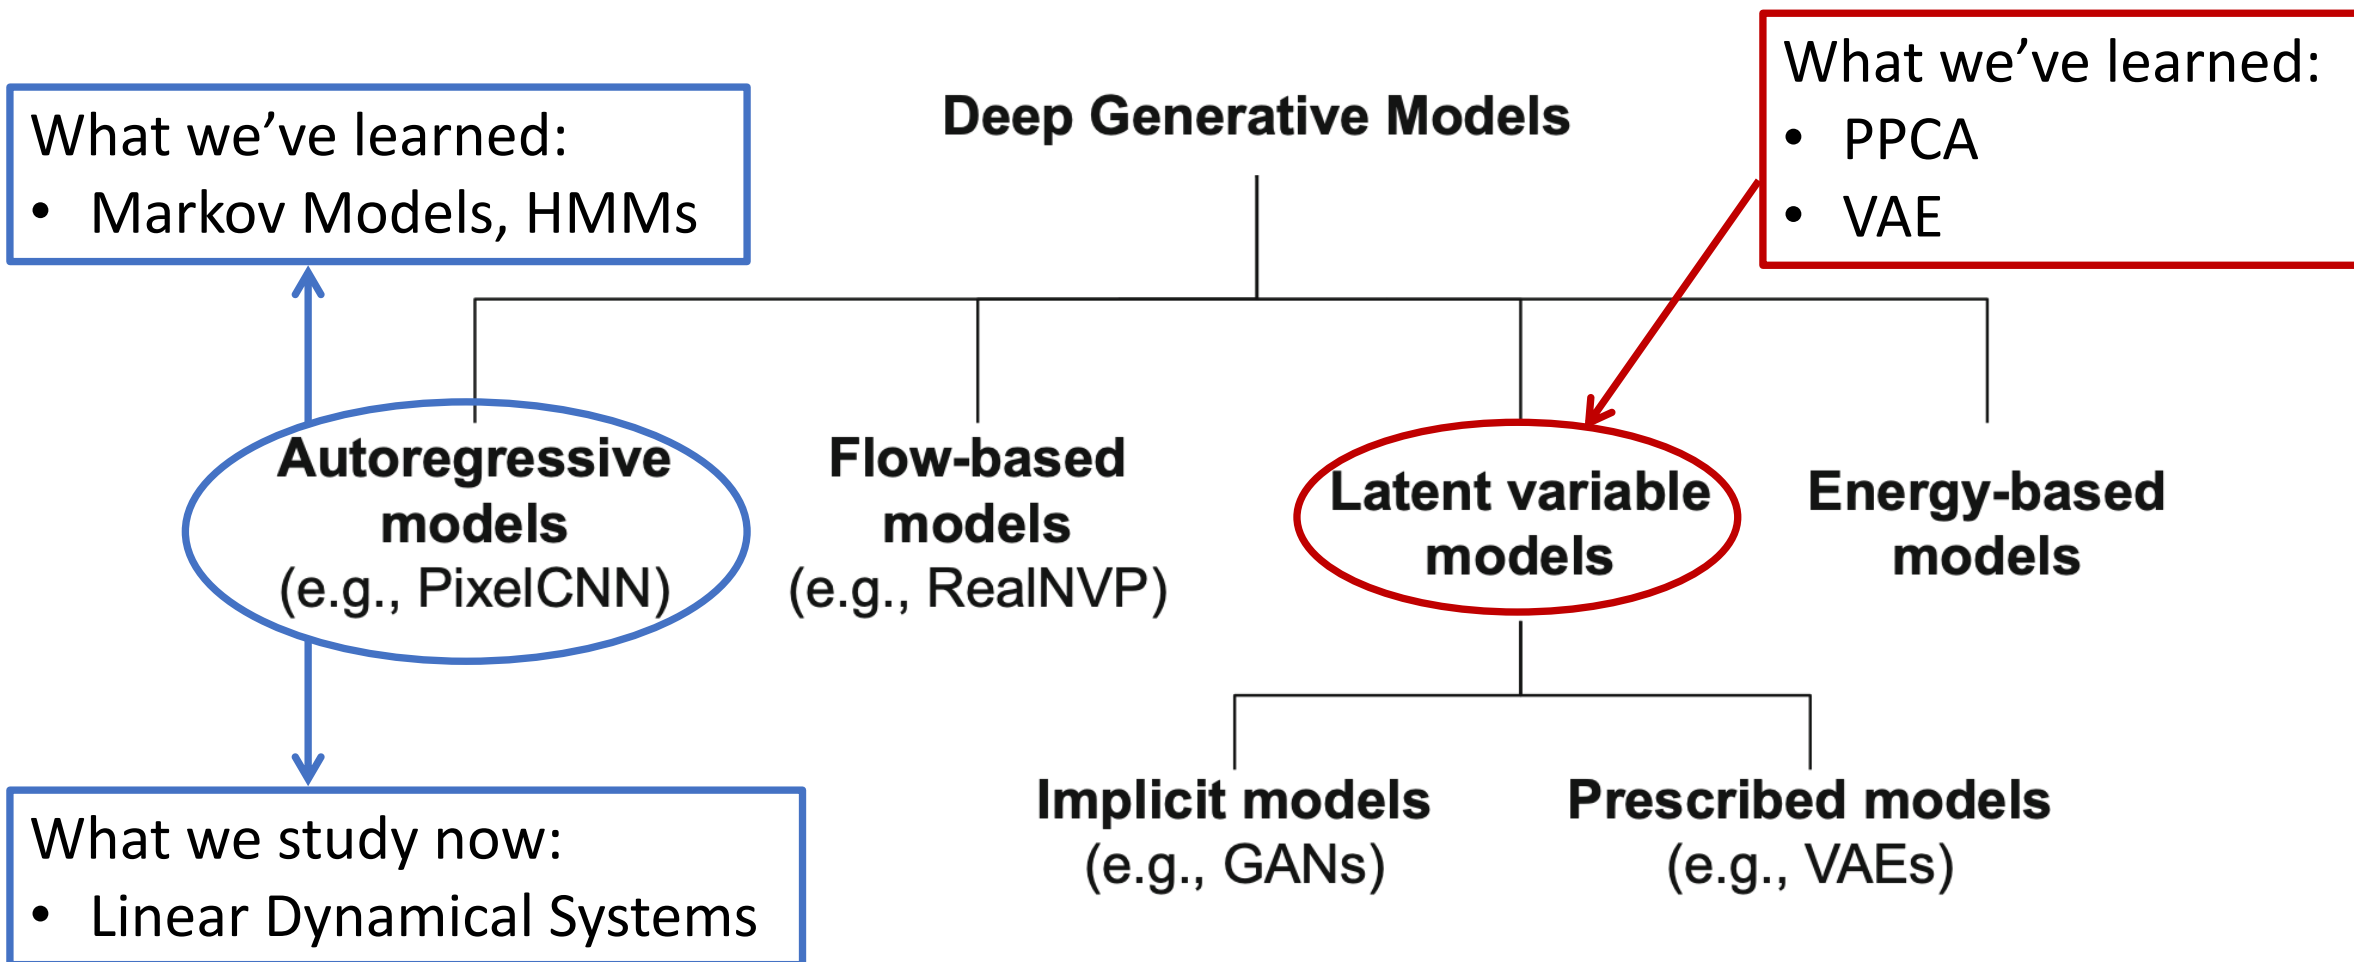

Fall Semester 2025

René Vidal

Director of the Center for Innovation in Data Engineering and Science (IDEAS),
Rachleff University Professor, University of Pennsylvania
Amazon Scholar & Chief Scientist at NORCE

Taxonomy of Generative Models

HMMs and Linear Dynamical Systems

Hidden Markov Models (HMMs)

- Hidden state Z_t and observation X_t are **discrete random scalar variables**
- State transition and emission are **discrete**

Linear Dynamical Systems (LDSs)

- Hidden state Z_t and observation X_t are **continuous (random) vectors**
- State transition and emission are **linear**

Linear Dynamical Systems

- Hidden state Z_t and observation Y_t are **continuous (random) vectors**
- State transition and emission are **linear**

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

d : state dimension

D : output dimension

$$\Sigma_0 \in \mathbb{R}^{d \times d}$$
$$\Sigma_0 \succ 0$$

$$A \in \mathbb{R}^{d \times d}$$
$$C \in \mathbb{R}^{D \times d}$$

$$Q \in \mathbb{R}^{d \times d}$$
$$Q \succ 0$$

$$R \in \mathbb{R}^{D \times D}$$
$$R \succ 0$$

- Initial Distribution:

$$\mathbb{P}(Z_0) = \mathcal{N}(\pi_0, \Sigma_0)$$

- State Transition:

$$\mathbb{P}(Z_t \mid z_{t-1}) = \mathcal{N}(Az_{t-1}, Q) \xrightarrow{\text{Why}} \text{this implies "Markov Property"}$$

- State Emission:

$$\mathbb{P}(X_t \mid z_t) = \mathcal{N}(Cz_t, R) \xrightarrow{\text{Why}} \text{this implies "Output Independence"}$$

Filtering and Smoothing

- **P1: Filtering.** Given θ and (x_0, \dots, x_t) , infer the current state z_t , that is to compute
$$p_{\theta}(z_t \mid x_0, \dots, x_t)$$
 - e.g., what is the current state of the missile given its position over some past time?
- **P2: Smoothing.** Given θ and (x_0, \dots, x_T) , infer the past state z_t , that is to compute
$$p_{\theta}(z_t \mid x_0, \dots, x_T)$$
 - e.g., where did the missile originate given we observed it over some time?
- **Remark.** You may find **P1** and **P2** familiar
 - In HMMs, we solved them via recursively updating $\alpha_j(t), \gamma_j(t)$

Background

- Before solving the filtering and smoothing problem, we will study (review) some basic properties about LDSs and Gaussian variables

Law of Total Expectation and of Total Variance

- We will heavily use the following basic results:

- Law of Total Expectation (LoTE)

$$\mathbb{E}[a] = \mathbb{E}_b[\mathbb{E}_a[a \mid b]]$$

- Law of Total Covariance (LoTC)

$$\text{Cov}(a) = \mathbb{E}[\text{Cov}(a \mid b)] + \text{Cov}(\mathbb{E}[a \mid b])$$

$$\begin{aligned}\text{Cov}(a, b) &:= \mathbb{E}[(a - \mathbb{E}[a])(b - \mathbb{E}[b])^\top] \\ \text{Cov}(a) &:= \text{Cov}(a, a)\end{aligned}$$

Basic Properties

- Hidden state Z_t and observation X_t are **continuous (random) vectors**
- State transition and emission are **linear**

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

d : state dimension

D : output dimension

$$\Sigma_0 \in \mathbb{R}^{d \times d}$$

$$\Sigma_0 \succ 0$$

$$A \in \mathbb{R}^{d \times d}$$

$$C \in \mathbb{R}^{D \times d}$$

$$Q \in \mathbb{R}^{d \times d}$$

$$Q \succ 0$$

$$R \in \mathbb{R}^{D \times D}$$

$$R \succ 0$$

• Equivalent Descriptions:

	Probabilistic Description	Algebraic Description
State Transition	$\mathbb{P}(Z_t z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$	$Z_t = Az_{t-1} + w_t$ with $w_t \sim \mathcal{N}(0, Q)$
State Emission	$\mathbb{P}(X_t z_t) = \mathcal{N}(Cz_t, R)$	$X_t = Cz_t + v_t$ with $v_t \sim \mathcal{N}(0, R)$

- We assume w_t, v_t are independent from each other and independent from z_0

Basic Properties

- Hidden state Z_t and observation X_t are **continuous (random) vectors**
- State transition and emission are **linear**

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

d : state dimension

D : output dimension

$$\Sigma_0 \in \mathbb{R}^{d \times d}$$

$$\Sigma_0 \succ 0$$

$$A \in \mathbb{R}^{d \times d}$$

$$C \in \mathbb{R}^{D \times d}$$

$$Q \in \mathbb{R}^{d \times d}$$

$$Q \succ 0$$

$$R \in \mathbb{R}^{D \times D}$$

$$R \succ 0$$

- Joint distribution is Gaussian:

Gaussian

$$p_{\theta}(x_0, \dots, x_T, z_0, \dots, z_T) = p_{\theta}(z_0) \prod_{t=0}^T p_{\theta}(x_t | z_t) \prod_{t=1}^T p_{\theta}(z_t | z_{t-1})$$

- Therefore, “any conditional distribution of it” is Gaussian
 - Vague, but look at your question 1 of homework 1 (next page)

Gaussian Conditioning (HW 1)

- If $\begin{bmatrix} a \\ b \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \mu_a \\ \mu_b \end{bmatrix}, \begin{bmatrix} \Sigma_{aa} & \Sigma_{ab} \\ \Sigma_{ba} & \Sigma_{bb} \end{bmatrix} \right)$, then the conditional distribution $p(a \mid b)$ is Gaussian with mean $\mu_{a|b}$ and covariance $\Sigma_{a|b}$ given by

$$\mu_{a|b} = \mu_a + \Sigma_{ab} \Sigma_{bb}^{-1} (b - \mu_b)$$

original mean & variance of a

correction upon observing b

$$\Sigma_{a|b} = \Sigma_{aa} - \Sigma_{ab} \Sigma_{bb}^{-1} \Sigma_{ba}$$

Gaussian Combining (Extension of Problem 1b, HW 1)

Gaussian Combining: If $x = Cz + v$ with $z \sim \mathcal{N}(\mu_z, \Sigma_z)$ and $v \sim \mathcal{N}(0, \Sigma_v)$ then

$$\begin{bmatrix} z \\ x \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \mu_z \\ C\mu_z \end{bmatrix}, \begin{bmatrix} \Sigma_z & \Sigma_z C^\top \\ C\Sigma_z & C\Sigma_z C^\top + \Sigma_v \end{bmatrix} \right)$$

• **Proof:** The proof is finished by computing the following quantities:

- $\mathbb{E}[x] = \mathbb{E}_z \left[\mathbb{E}_y[x \mid z] \right] = \mathbb{E}_z[Cz + v] = \mathbb{E}_z[Cz] = C\mu_z$
- $\text{Cov}(z, x) = \mathbb{E}[(z - \mu_z)(x - C\mu_z)^\top] = \mathbb{E}[(z - \mu_z)(Cz + v - C\mu_z)^\top] = \Sigma_z C^\top$
- $\text{Cov}(x) = \mathbb{E}[(x - C\mu_z)(x - C\mu_z)^\top] = \mathbb{E}_z \left[\mathbb{E}_y[(x - C\mu_z)(x - C\mu_z)^\top \mid z] \right]$
 $= \mathbb{E}_{z,v}[(Cz + v - C\mu_z)(Cz + v - C\mu_z)^\top]$
 $= \mathbb{E}_z[(Cz - C\mu_z)(Cz - C\mu_z)^\top] + R$
 $= C \cdot \mathbb{E}_z[(z - \mu_z)(z - \mu_z)^\top] \cdot C^\top + R = C\Sigma_z C^\top + R$

Remark. In the proof, **LoTE** is used at the **colored** equality

Filtering and Smoothing

- **P1: Filtering.** Given θ and (x_0, \dots, x_t) , compute
$$p_{\theta}(z_t \mid x_0, \dots, x_t)$$
- **P2: Smoothing.** Given θ and (x_0, \dots, x_T) , compute
$$p_{\theta}(z_t \mid x_0, \dots, x_T)$$
- Since $p_{\theta}(z_s \mid x_0, \dots, x_t)$ is Gaussian $(\forall s, t)$, so it suffices to compute
$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \mathbb{E} \left[(z_s - \hat{z}_{s|t})(z_s - \hat{z}_{s|t})^{\top} \mid x_0, \dots, x_t \right] = \text{Cov}(z_s \mid x_0, \dots, x_t)$$
 - and we will do so recursively (first for filtering and then for smoothing)

Filtering: Compute $\hat{z}_{0|0}$, $\hat{\Sigma}_{0|0}$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s \mid x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s \mid x_0, \dots, x_t)\end{aligned}$$

- **P1: Filtering.** Given θ and (x_0, \dots, x_t) , compute $p_\theta(z_t \mid x_0, \dots, x_t)$
- Let's begin with the simplest case:
 - What are the mean $\hat{z}_{0|0} = \mathbb{E}[z_0 \mid x_0]$ and covariance $\hat{\Sigma}_{0|0} = \text{Cov}(z_0 \mid x_0)$ of z_0 given x_0 ?
- **High-level Idea.**
 1. find the mean and covariance of $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$ via **Gaussian combining**
 2. find the mean $\hat{z}_{0|0}$ and covariance $\hat{\Sigma}_{0|0}$ of $z_0 \mid x_0$ via **Gaussian conditioning**

$$\mu_{a|b} = \mu_a + \Sigma_{ab}\Sigma_{bb}^{-1}(b - \mu_b), \quad \Sigma_{a|b} = \Sigma_{aa} - \Sigma_{ab}\Sigma_{bb}^{-1}\Sigma_{ba}$$

Filtering: Compute $\hat{z}_{0|0}$, $\hat{\Sigma}_{0|0}$

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

- **Step 1**: find the mean and covariance of $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$

$$\mathbb{P}(Z_0) = \mathcal{N}(\pi_0, \Sigma_0)$$
$$\mathbb{P}(X_t \mid z_t) = \mathcal{N}(Cz_t, R)$$

Gaussian Combining: If $x = Cz + v$ with $z \sim \mathcal{N}(\mu_z, \Sigma_z)$ and $v \sim \mathcal{N}(0, \Sigma_v)$ then

$$\begin{bmatrix} z \\ x \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \mu_z \\ C\mu_z \end{bmatrix}, \begin{bmatrix} \Sigma_z & \Sigma_z C^\top \\ C\Sigma_z & C\Sigma_z C^\top + \Sigma_v \end{bmatrix} \right)$$

- Applying **Gaussian combining** yields

$$\begin{bmatrix} z_0 \\ x_0 \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \pi_0 \\ C\pi_0 \end{bmatrix}, \begin{bmatrix} \Sigma_0 & \Sigma_0 C^\top \\ C\Sigma_0 & C\Sigma_0 C^\top + R \end{bmatrix} \right)$$

Filtering: Compute $\hat{z}_{0|0}$, $\hat{\Sigma}_{0|0}$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s \mid x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s \mid x_0, \dots, x_t)\end{aligned}$$

- Step 2: apply Gaussian conditioning to $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$

$$\mu_{a|b} = \mu_a + \Sigma_{ab}\Sigma_{bb}^{-1}(b - \mu_b), \quad \Sigma_{a|b} = \Sigma_{aa} - \Sigma_{ab}\Sigma_{bb}^{-1}\Sigma_{ba}$$

$$\begin{bmatrix} z_0 \\ x_0 \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \pi_0 \\ C\pi_0 \end{bmatrix}, \begin{bmatrix} \Sigma_0 & \Sigma_0 C^\top \\ C\Sigma_0 & C\Sigma_0 C^\top + R \end{bmatrix} \right)$$

- We have

$$\hat{z}_{0|0} = \pi_0 + \Sigma_0 C^\top (C\Sigma_0 C^\top + R)^{-1} (x_0 - C\pi_0)$$

$$\hat{\Sigma}_{0|0} = \Sigma_0 - \Sigma_0 C^\top (C\Sigma_0 C^\top + R)^{-1} C\Sigma_0$$

Filtering: From 0 to t

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

- **P1: Filtering.** Given θ and (x_0, \dots, x_t) , compute
$$p_{\theta}(z_t \mid x_0, \dots, x_t)$$
- We've now computed $\hat{z}_{0|0}$ and $\hat{\Sigma}_{0|0}$. This solves **P1** for the case $t = 0$
- To proceed, we will update $\hat{z}_{t-1|t-1}, \hat{\Sigma}_{t-1|t-1}$ into $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$ for every t

The planned computational flow

Filtering: From 0 to t

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

- To compute $\hat{z}_{0|0}$ and $\hat{\Sigma}_{0|0}$, we
 - (Step 0) found the mean and covariance of z_0 (already known)
 - (Step 1) found the mean and covariance of $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$ via **Gaussian combining**
 - (Step 2) found the mean and covariance of $z_0 \mid x_0$ via **Gaussian conditioning**

Question: How can we generalize these steps for general t ?

- To update $\hat{z}_{t-1|t-1}$, $\hat{\Sigma}_{t-1|t-1}$ into $\hat{z}_{t|t}$, $\hat{\Sigma}_{t|t}$, we will **condition on x_0, \dots, x_{t-1}** and
 - (Step 0) find the mean and covariance of $z_t \mid x_0, \dots, x_{t-1}$ (using $\hat{z}_{t-1|t-1}$, $\hat{\Sigma}_{t-1|t-1}$)
 - (Step 1) find the mean and covariance of $\begin{bmatrix} z_t \\ x_t \end{bmatrix} \mid x_0, \dots, x_{t-1}$ via **Gaussian combining**
 - (Step 2) find the mean and covariance of $z_t \mid x_t, x_0, \dots, x_{t-1}$ via **Gaussian conditioning**

Step 0 and conditioning on x_0, \dots, x_{t-1} are the only differences

- **You should be able to figure out all the details without looking at the rest slides**

Filtering: Compute $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s \mid x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s \mid x_0, \dots, x_t)\end{aligned}$$

- **Step 0:** find the mean and covariance of $z_t \mid x_0, \dots, x_{t-1}$
 - By definition, this is to compute $\hat{z}_{t|t-1}, \hat{\Sigma}_{t|t-1}$

$$\mathbb{P}(Z_t \mid z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$$

- We have

$$\begin{aligned}\hat{z}_{t|t-1} &= \mathbb{E}[z_t \mid x_0, \dots, x_{t-1}] = \mathbb{E}_{z_{t-1}} \left[\mathbb{E}_{z_t} [z_t \mid z_{t-1}, x_0, \dots, x_{t-1}] \right] \\ &= \mathbb{E}[Az_{t-1} \mid x_0, \dots, x_{t-1}] = A\hat{z}_{t-1|t-1}\end{aligned}$$

$$\hat{\Sigma}_{t|t-1} = \mathbb{E} \left[(z_t - \hat{z}_{t|t-1})(z_t - \hat{z}_{t|t-1})^\top \mid x_0, \dots, x_{t-1} \right] = \cdots = A\hat{\Sigma}_{t-1|t-1}A^\top + Q$$

↑
similar to how we computed $\text{Cov}(y)$ in
the proof of **Gaussian combining**

Filtering: Compute $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$

- **Step 1**: find the mean and covariance of $\begin{bmatrix} z_t \\ x_t \end{bmatrix} | x_0, \dots, x_{t-1}$

- We applied **Gaussian combining** to $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$ and obtained

$$\bullet \begin{bmatrix} z_0 \\ x_0 \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \hat{z}_{0|-1} \\ C \hat{z}_{0|-1} \end{bmatrix}, \begin{bmatrix} \hat{\Sigma}_{0|-1} & \hat{\Sigma}_{0|-1} C^\top \\ C \hat{\Sigma}_{0|-1} & C \hat{\Sigma}_{0|-1} C^\top + R \end{bmatrix} \right)$$

- Similarly, now, applying **Gaussian combining** to $\begin{bmatrix} z_t \\ x_t \end{bmatrix} | x_0, \dots, x_{t-1}$ gives:

$$\bullet \begin{bmatrix} z_t \\ x_t \end{bmatrix} | x_0, \dots, x_{t-1} \sim \mathcal{N} \left(\begin{bmatrix} \hat{z}_{t|t-1} \\ C \hat{z}_{t|t-1} \end{bmatrix}, \begin{bmatrix} \hat{\Sigma}_{t|t-1} & \hat{\Sigma}_{t|t-1} C^\top \\ C \hat{\Sigma}_{t|t-1} & C \hat{\Sigma}_{t|t-1} C^\top + R \end{bmatrix} \right)$$

$$\begin{aligned} \hat{z}_{s|t} &:= \mathbb{E}[z_s | x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s | x_0, \dots, x_t) \end{aligned}$$

$$\begin{aligned} \hat{z}_{t|t-1} &= A \hat{z}_{t-1|t-1} \\ \hat{\Sigma}_{t|t-1} &= A \hat{\Sigma}_{t-1|t-1} A^\top + Q \end{aligned}$$

$$\hat{z}_{0|-1} := \pi_0, \quad \hat{\Sigma}_{0|-1} := \Sigma_0$$

Filtering: Compute $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s \mid x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s \mid x_0, \dots, x_t)\end{aligned}$$

- Step 2: apply Gaussian conditioning to $\begin{bmatrix} z_t \\ x_t \end{bmatrix} \mid x_0, \dots, x_{t-1}$

$$\begin{aligned}\hat{z}_{t|t-1} &= A\hat{z}_{t-1|t-1} \\ \hat{\Sigma}_{t|t-1} &= A\hat{\Sigma}_{t-1|t-1}A^\top + Q\end{aligned}$$

$$\hat{z}_{0|-1} := \pi_0, \quad \hat{\Sigma}_{0|-1} := \Sigma_0$$

- We applied Gaussian conditioning to $\begin{bmatrix} z_0 \\ x_0 \end{bmatrix}$ and obtained:

$$\hat{z}_{0|0} = \hat{z}_{0|-1} + \hat{\Sigma}_{0|-1}C^\top (C\hat{\Sigma}_{0|-1}C^\top + R)^{-1} (x_0 - C\hat{z}_{0|-1})$$

$$\hat{\Sigma}_{0|0} = \hat{\Sigma}_{0|-1} - \hat{\Sigma}_{0|-1}C^\top (C\hat{\Sigma}_{0|-1}C^\top + R)^{-1} C\hat{\Sigma}_{0|-1}$$

- Similarly, now, applying Gaussian conditioning to $\begin{bmatrix} z_t \\ x_t \end{bmatrix} \mid x_0, \dots, x_{t-1}$ gives:

$$\hat{z}_{t|t} = \hat{z}_{t|t-1} + \hat{\Sigma}_{t|t-1}C^\top (C\hat{\Sigma}_{t|t-1}C^\top + R)^{-1} (x_t - C\hat{z}_{t|t-1})$$

$$\hat{\Sigma}_{t|t} = \hat{\Sigma}_{t|t-1} - \underbrace{\hat{\Sigma}_{t|t-1}C^\top (C\hat{\Sigma}_{t|t-1}C^\top + R)^{-1}}_{\text{Kalman gain matrix}} C\hat{\Sigma}_{t|t-1}$$

“Kalman gain matrix”. Let us denote it by K_t

Summary: Filtering for LDSs

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

$$\mathbb{P}(Z_0) = \mathcal{N}(\pi_0, \Sigma_0)$$
$$\mathbb{P}(Z_t \mid z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$$
$$\mathbb{P}(X_t \mid z_t) = \mathcal{N}(Cz_t, R)$$

- Putting everything together gives **Kalman Filter**:

- Initialization: $\hat{z}_{0|-1} := \pi_0, \hat{\Sigma}_{0|-1} := \Sigma_0$
- Recursion ($\forall t = 0, \dots, T$):

“Correction”:

$$K_t = \hat{\Sigma}_{t|t-1} C^\top (C \hat{\Sigma}_{t|t-1} C^\top + R)^{-1}$$

$$\hat{z}_{t|t} = \hat{z}_{t|t-1} + K_t (x_t - C \hat{z}_{t|t-1})$$

$$\hat{\Sigma}_{t|t} = \hat{\Sigma}_{t|t-1} - K_t C \hat{\Sigma}_{t|t-1}$$

“Prediction”:

$$\hat{z}_{t+1|t} = A \hat{z}_{t|t}$$

$$\hat{\Sigma}_{t+1|t} = A \hat{\Sigma}_{t|t} A^\top + Q$$

How To Derive Kalman Filter

$$p(z_{t-1} \mid x_0, \dots, x_{t-1})$$

Prediction

$$p(z_t \mid x_0, \dots, x_{t-1})$$

Gaussian Combining

$$p(z_t, x_t \mid x_0, \dots, x_{t-1})$$

Gaussian Conditioning

$$p(z_t \mid x_0, \dots, x_{t-1}, x_t)$$

Correction

Computational Trajectory of Kalman Filter

From Filtering to Smoothing

$$\hat{z}_{s|t} := \mathbb{E}[z_s | x_0, \dots, x_t]$$

$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s | x_0, \dots, x_t)$$

- **P1: Filtering**. Given θ and (x_0, \dots, x_t) , compute $p_\theta(z_t | x_0, \dots, x_t)$
- **P2: Smoothing**. Given θ and (x_0, \dots, x_T) , compute $p_\theta(z_t | x_0, \dots, x_T)$
- Since everything is Gaussian, to solve **P2** it suffices to compute $\hat{z}_{t|T}, \hat{\Sigma}_{t|T}$ for all t

What **Kalman Filter** gives us:

What we will do to solve **P2**:

Goal: Given $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$ and $\hat{z}_{t|t-1}, \hat{\Sigma}_{t|t-1}$ for every t , update $\hat{z}_{t|T}, \hat{\Sigma}_{t|T}$ into $\hat{z}_{t-1|T}, \hat{\Sigma}_{t-1|T}$

Smoothing

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

Goal: Given $\hat{z}_{t|t}, \hat{\Sigma}_{t|t}$ and $\hat{z}_{t|t-1}, \hat{\Sigma}_{t|t-1}$ for every t , update $\hat{z}_{t|T}, \hat{\Sigma}_{t|T}$ into $\hat{z}_{t-1|T}, \hat{\Sigma}_{t-1|T}$

- **Observation:**

- Since z_{t-1} is independent of x_t, \dots, x_T given z_t , we have

$$p_{\theta}(z_{t-1} \mid z_t, x_0, \dots, x_{t-1}) = p_{\theta}(z_{t-1} \mid z_t, x_0, \dots, x_T)$$

- **High-level Idea:**

1. Compute $p_{\theta}(z_{t-1} \mid z_t, x_0, \dots, x_{t-1})$ via **Gaussian combining** and **Gaussian conditioning**
 - This gives us $p_{\theta}(z_{t-1} \mid z_t, x_0, \dots, x_T)$
2. Given $p_{\theta}(z_{t-1} \mid z_t, x_0, \dots, x_T)$, update $\hat{z}_{t|T}, \hat{\Sigma}_{t|T}$ into $\hat{z}_{t-1|T}, \hat{\Sigma}_{t-1|T}$ via **LoTE** and **LoTC**

Smoothing

$$\mathbb{P}(Z_t | z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s | x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s | x_0, \dots, x_t)\end{aligned}$$

- **Step 1:** Compute $p_\theta(z_{t-1} | z_t, x_0, \dots, x_{t-1})$

Gaussian Combining: If $x = Cz + v$ with $z \sim \mathcal{N}(\mu_z, \Sigma_z)$ and $v \sim \mathcal{N}(0, \Sigma_v)$ then

$$\begin{bmatrix} z \\ x \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \mu_z \\ C\mu_z \end{bmatrix}, \begin{bmatrix} \Sigma_z & \Sigma_z C^\top \\ C\Sigma_z & \textcolor{red}{C\Sigma_z C^\top + \Sigma_v} \end{bmatrix} \right)$$

Gaussian Conditioning: $\mu_{a|b} = \mu_a + \Sigma_{ab}\Sigma_{bb}^{-1}(b - \mu_b)$, $\Sigma_{a|b} = \Sigma_{aa} - \Sigma_{ab}\Sigma_{bb}^{-1}\Sigma_{ba}$

- **Step 1.1:** Applying **Gaussian combining** to $\begin{bmatrix} z_{t-1} \\ z_t \end{bmatrix} | x_0, \dots, x_{t-1}$ gives:

$$\begin{bmatrix} z_{t-1} \\ z_t \end{bmatrix} | x_0, \dots, x_{t-1} \sim \mathcal{N} \left(\begin{bmatrix} \hat{z}_{t-1|t-1} \\ \hat{z}_{t|t-1} \end{bmatrix}, \begin{bmatrix} \hat{\Sigma}_{t-1|t-1} & \hat{\Sigma}_{t-1|t-1} A^\top \\ A\hat{\Sigma}_{t-1|t-1} & \textcolor{red}{\hat{\Sigma}_{t|t-1}} \end{bmatrix} \right)$$

$$\textcolor{red}{\hat{\Sigma}_{t|t-1}} = A\hat{\Sigma}_{t-1|t-1}A^\top + Q$$

- **Step 1.2:** From **Gaussian conditioning** we see $z_{t-1} | z_t, x_0, \dots, x_{t-1}$ has distribution:

$$\mathcal{N}(\hat{z}_{t-1|t-1} + \textcolor{blue}{L}_{t-1}(z_t - \hat{z}_{t|t-1}), \hat{\Sigma}_{t-1|t-1} - \textcolor{blue}{L}_{t-1}A\hat{\Sigma}_{t-1|t-1})$$

$$\textcolor{blue}{L}_{t-1} := \hat{\Sigma}_{t-1|t-1}A^\top \hat{\Sigma}_{t|t-1}^{-1}$$

Remark. Note that $\textcolor{blue}{L}_{t-1}A\hat{\Sigma}_{t-1|t-1} = \textcolor{blue}{L}_{t-1}\hat{\Sigma}_{t|t-1}\textcolor{blue}{L}_{t-1}^\top$, so the covariance $\hat{\Sigma}_{t-1|t-1} - \textcolor{blue}{L}_{t-1}A\hat{\Sigma}_{t-1|t-1}$ is symmetric

Smoothing

$$L_{t-1} = \hat{\Sigma}_{t-1|t-1} A^\top \hat{\Sigma}_{t|t-1}^{-1}$$

$$\begin{aligned}\hat{z}_{s|t} &:= \mathbb{E}[z_s | x_0, \dots, x_t] \\ \hat{\Sigma}_{s|t} &:= \text{Cov}(z_s | x_0, \dots, x_t)\end{aligned}$$

- We have obtained

$$p_\theta(z_{t-1} | z_t, x_0, \dots, x_T) = \mathcal{N}(\hat{z}_{t-1|t-1} + L_{t-1}(z_t - \hat{z}_{t|t-1}), \hat{\Sigma}_{t-1|t-1} - L_{t-1} \hat{\Sigma}_{t|t-1} L_{t-1}^\top)$$

- Step 2: update $\hat{z}_{t|T}, \hat{\Sigma}_{t|T}$ into $\hat{z}_{t-1|T}, \hat{\Sigma}_{t-1|T}$ via LoTE and LoTC

$$\begin{aligned}\hat{z}_{t-1|T} &= \mathbb{E}[z_{t-1} | x_0, \dots, x_T] = \mathbb{E}_{z_t}[\mathbb{E}_{z_{t-1}}[z_{t-1} | z_t, x_0, \dots, x_T]] \\ &= \mathbb{E}_{z_t}[\hat{z}_{t-1|t-1} + L_{t-1}(z_t - \hat{z}_{t|t-1}) | x_0, \dots, x_T] \\ &= \hat{z}_{t-1|t-1} + L_{t-1}(\hat{z}_{t|T} - \hat{z}_{t|t-1})\end{aligned}$$

$$\begin{aligned}\hat{\Sigma}_{t-1|T} &= \text{Cov}(z_{t-1} | x_0, \dots, x_T) = \mathbb{E}[\text{Cov}(z_{t-1} | z_t, x_0, \dots, x_T)] + \text{Cov}(\mathbb{E}[z_{t-1} | z_t, x_0, \dots, x_T]) \\ &= \mathbb{E}[\hat{\Sigma}_{t-1|t-1} - L_{t-1} \hat{\Sigma}_{t|t-1} L_{t-1}^\top] + \text{Cov}(\hat{z}_{t-1|t-1} + L_{t-1}(z_t - \hat{z}_{t|t-1})) \\ &= \hat{\Sigma}_{t-1|t-1} - L_{t-1} \hat{\Sigma}_{t|t-1} L_{t-1}^\top + \text{Cov}(\hat{z}_{t-1|t-1} + L_{t-1}(z_t - \hat{z}_{t|t-1}) | x_0, \dots, x_T) \\ &= \hat{\Sigma}_{t-1|t-1} + L_{t-1}(\hat{\Sigma}_{t|T} - \hat{\Sigma}_{t|t-1}) L_{t-1}^\top\end{aligned}$$

Summary: Smoothing for LDSs

$$\hat{z}_{s|t} := \mathbb{E}[z_s \mid x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s \mid x_0, \dots, x_t)$$

- **Goal.** Given θ and (x_0, \dots, x_T) , compute
$$p_{\theta}(z_t \mid x_0, \dots, x_T)$$
- **Algorithm** (known as “Rauch-Tung-Striebel smoother”).
 1. (Forward Pass) Run Kalman filtering to compute $\hat{z}_{t|t}$, $\hat{\Sigma}_{t|t}$ and $\hat{z}_{t+1|t}$, $\hat{\Sigma}_{t+1|t}$ for all t
 2. (Backward Pass) For $t = T, \dots, 1$, compute the following:
 - $L_{t-1} = \hat{\Sigma}_{t-1|t-1} A^T \hat{\Sigma}_{t|t-1}^{-1}$
 - $\hat{z}_{t-1|T} = \hat{z}_{t-1|t-1} + L_{t-1}(\hat{z}_{t|T} - \hat{z}_{t|t-1})$
 - $\hat{\Sigma}_{t-1|T} = \hat{\Sigma}_{t-1|t-1} + L_{t-1}(\hat{\Sigma}_{t|T} - \hat{\Sigma}_{t|t-1})L_{t-1}^T$

Computational Trajectory of Smoothing:

Remark: L_{t-1} might also be computed in the forward pass

State Estimation and Learning

- Now that we've studied algorithms for filtering and smoothing, we are prepared to perform more complicated tasks
- **State Estimation ("Decoding")**. Given θ and (x_0, \dots, x_T) , solve:

$$\operatorname{argmax}_{z_0, \dots, z_T} p_{\theta}(z_0, \dots, z_T \mid x_0, \dots, x_T)$$

- **Learning**. Given N observations $\{\mathbf{x}^{(n)}\}_{n=1}^N$, find best θ :

$$\max_{\theta} \prod_{n=1}^N p_{\theta}(\mathbf{x}^{(n)})$$

State Estimation

$$\hat{z}_{s|t} := \mathbb{E}[z_s | x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s | x_0, \dots, x_t)$$

- **State Estimation.** Given θ and (x_0, \dots, x_T) , solve:
$$\underset{z_0, \dots, z_T}{\operatorname{argmax}} p_{\theta}(z_0, \dots, z_T | x_0, \dots, x_T)$$

- **Solution:**

- Since $p_{\theta}(z_0, \dots, z_T | x_0, \dots, x_T)$ is Gaussian, the optimal solution to state estimation is

$$\mathbb{E} \left[\begin{bmatrix} z_0 \\ z_1 \\ \vdots \\ z_T \end{bmatrix} \middle| x_0, \dots, x_T \right] = \begin{bmatrix} \mathbb{E}[z_0 | x_0, \dots, x_T] \\ \mathbb{E}[z_1 | x_0, \dots, x_T] \\ \vdots \\ \mathbb{E}[z_T | x_0, \dots, x_T] \end{bmatrix} = \begin{bmatrix} \hat{z}_{0|T} \\ \hat{z}_{1|T} \\ \vdots \\ \hat{z}_{T|T} \end{bmatrix}$$

- Therefore, the state estimation problem can be solved by smoothing
- Similarly, we can prove the output $\hat{z}_{t|t}$ of the Kalman filter solves $\max_{z_t} p_{\theta}(z_t | x_0, \dots, x_t)$

Learning

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

- **Learning.** Given N observations $\{\mathbf{x}^{(n)}\}_{n=1}^N$, find best θ :

$$\max_{\theta} \prod_{n=1}^N p_{\theta}(\mathbf{x}^{(n)})$$

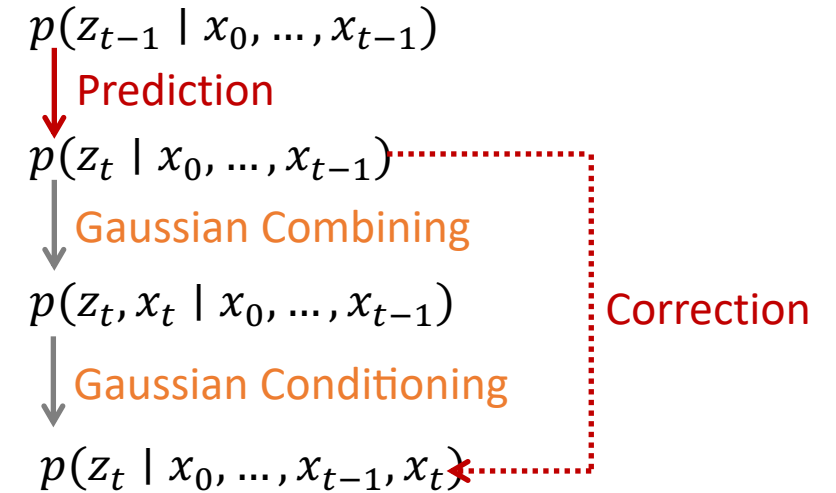

- **We can perform learning via the EM algorithm**
 - derivations are algebraically involved and are given at the end of the slides.

Possible Extensions of Linear Dynamical Systems

- What if
 - we do **not** have Gaussians?
 - we have time-varying dynamics?
 - $Z_t = A_t z_{t-1} + w_t$, $X_t = C_t z_t + v_t$
 - we have **control** over states?
 - $Z_t = A z_{t-1} + U q_t + w_t$
 - we have **nonlinear** dynamics?
 - $Z_t = f(z_{t-1}) + w_t$, $X_t = g(z_t) + v_t$

How To Derive Kalman Filter

Deep Generative Models: Dynamic Textures

Fall Semester 2025

René Vidal

Director of the Center for Innovation in Data Engineering and Science (IDEAS),
Rachleff University Professor, University of Pennsylvania
Amazon Scholar & Chief Scientist at NORCE

Taxonomy of Generative Models

What we've learned:

- Markov Models, HMMs, LDSs

Deep Generative Models

Autoregressive models
(e.g., PixelCNN)

Flow-based models
(e.g., RealNVP)

Latent variable models

Energy-based models

Implicit models
(e.g., GANs)

Prescribed models
(e.g., VAEs)

What we study now:

- Application to Video Generation:
Dynamic Textures

What we've learned:

- PPCA
- VAE

Motivation: Dynamic Textures

- Dynamic textures are videos of nonrigid deformable objects such as water, fire, smoke, flags moving with the wind, etc.

- Dynamic textures are characterized by appearance + dynamics

Need a model that
captures the
appearance and
dynamics

Dynamic Texture Model

- A video is a sequence of T images $\{I_t \in \mathbb{R}^D\}_{t=0}^T$, where D is the number of pixels.
- Suppose at each time instant we observe a noisy version of the image

$$x_t = I_t + v_t$$

where $v_t \sim \mathcal{N}(0, Q)$ is an i.i.d. sequence Gaussian noise.

- Suppose each image I_t is generated via a latent representation z_t as follows:

$$I_t = C_0 + Cz_t$$

- If $Q = \sigma_v^2 I_D$ and $z_t \sim^{i.i.d.} \mathcal{N}(0, I_d)$, then $x_t = C_0 + Cz_t + v_t$ is a PPCA model,
 - C_0 is the mean image/average video frame and C_i is the i th principal direction/eigenimage.
- However, this is not a good model for video because all frames are i.i.d.

Dynamic Texture Model

- To capture the temporal evolution of a video, instead of assuming z_t i.i.d., we assume that z_t is a linear autoregressive model $z_{t+1} = Az_t + w_t$.
- We say the video sequence $\{x_t \in \mathbb{R}^D\}_{t=0}^T$ is a **linear dynamic texture** if

$$\begin{aligned} z_{t+1} &= Az_t + w_t \\ x_t &= C_0 + Cz_t + v_t \end{aligned}$$

where

- D is the number of pixels and T is the number of frames
- $z_t \in \mathbb{R}^d$ is the hidden state, d is its dimension, and z_0 is the initial state
- $w_t \sim \mathcal{N}(0, Q)$ is the state noise, i.i.d. sequence, assumed to be independent from z_t
- $v_t \sim \mathcal{N}(0, R)$ is the output noise, i.i.d. sequence, assumed to be independent from z_t
- $A \in \mathbb{R}^{d \times d}$, $C_0 \in \mathbb{R}^D$, $C \in \mathbb{R}^{D \times d}$, $Q \in \mathbb{R}^{d \times d}$ and $R \in \mathbb{R}^{D \times D}$ are the model parameters

Dynamic Textures

$$z_{t+1} = Az_t + w_t$$
$$x_t = C_0 + Cz_t + v_t$$

(Soatto ICCV 01, Doretto IJCV 03)

$$C_0 \in \mathbb{R}^D$$
$$C \in \mathbb{R}^{D \times d}$$

APPEARANCE

$$A \in \mathbb{R}^{d \times d}$$
$$z_0 \in \mathbb{R}^d$$

DYNAMICS

$$Q \in \mathbb{R}^{d \times d}$$
$$R \in \mathbb{R}^{D \times D}$$

NOISE

Learning Dynamic Textures

- Let $\{x_t\}_{t=0\dots T}$, $x_t \in \mathbb{R}^D$ be an observed video sequence. Our goal is to learn the model parameters $\theta = \{A, C_0, C, Q, R\}$, a.k.a. the **system identification problem**.

- One method we have learned is **Maximum Likelihood Estimation (using EM)**

- Given x_0, \dots, x_T , solve

$$\hat{A}, \hat{C}_0, \hat{C}, \hat{Q}, \hat{R} = \operatorname{argmax}_{A, C_0, C, Q, R} \log p(x_0, \dots, x_T)$$

- subject to

$$\begin{aligned} z_{t+1} &= Az_t + w_t & t = 0, \dots, T-1, & \quad w_t \sim^{i.i.d.} \mathcal{N}(0, Q) & \quad t = 0, \dots, T \\ x_t &= C_0 + Cz_t + v_t & t = 0, \dots, T, & \quad v_t \sim^{i.i.d.} \mathcal{N}(0, R) & \quad t = 0, \dots, T \end{aligned}$$

- However, doing so is complicated and there is a simple approximate solution

Approximate Solutions (C_0)

- Let $\{x_t\}_{t=0\dots T}$, $x_t \in \mathbb{R}^D$ be an observed video sequence. Our goal is to learn the model parameters $\theta = \{A, C_0, C, Q, R\}$, a.k.a. the **system identification problem**.
- One method we have learned is **Maximum Likelihood Estimation (using EM)**

- Given x_0, \dots, x_T , solve

$$\hat{A}, \hat{C}_0, \hat{C}, \hat{Q}, \hat{R} = \operatorname{argmax}_{A, C_0, C, Q, R} \log p(x_0, \dots, x_T)$$

- subject to

$$\begin{aligned} z_{t+1} &= Az_t + w_t & t = 0, \dots, T-1, & \quad w_t \sim^{i.i.d.} \mathcal{N}(0, Q) & \quad t = 0, \dots, T \\ x_t &= C_0 + Cz_t + v_t & t = 0, \dots, T, & \quad v_t \sim^{i.i.d.} \mathcal{N}(0, R) & \quad t = 0, \dots, T \end{aligned}$$

- if $\mathbb{E}[z_0] = 0$, then $\mathbb{E}[z_t] = 0$ for all t
- $\mathbb{E}[x_t] = C_0 + C\mathbb{E}[z_t] + \mathbb{E}[v_t] = C_0$.
- so we can estimate C_0 as the mean video $\hat{C}_0 = \frac{1}{T} \sum x_t$
- subtract the mean from each frame ($x_t \leftarrow x_t - \hat{C}_0$) and we obtain a different LDS

Reformulation without C_0

- For our given process $\{z_t\}$, $z_t \in \mathbb{R}^d$, guided by

$$\begin{aligned} z_{t+1} &= Az_t + w_t & w_t &\sim \mathcal{N}(0, Q) & z(0) &= z_0 \\ x_t &= Cz_t + v_t & v_t &\sim \mathcal{N}(0, R) \end{aligned}$$

with initial condition $z(0) = z_0$, positive definite matrices R and Q .

- We seek the estimate parameters $A \in \mathbb{R}^{d \times d}$, $C \in \mathbb{R}^{D \times D}$, $Q \in \mathbb{S}_+^{d \times d}$, $R \in \mathbb{S}_+^{D \times D}$ from the given samples x_1, \dots, x_T that maximizes the log-likelihood

$$\hat{A}_T, \hat{C}_T, \hat{Q}_T, \hat{R}_T = \operatorname{argmax}_{A, C, Q, R} \log p(x_0, \dots, x_T)$$

Approximate Solutions (C and $Z_{0:T}$)

- Let $X_{0:T} = [x_0, \dots, x_T] \in \mathbb{R}^{D \times (T+1)}$, $Z_{0:T} = [z_0, \dots, z_T] \in \mathbb{R}^{d \times (T+1)}$ with $T + 1 > d$, $W_{0:T} = [w_0, \dots, w_T] \in \mathbb{R}^{d \times (T+1)}$
- Our assumption $D \gg d$, $\text{rank}(C) = d$ and $C^\top C = I_d$ allows us to rewrite the output equation as

$$X_{0:T} = CZ_{0:T} + W_{0:T}; \quad C \in \mathbb{R}^{D \times d}; \quad C^\top C = I_d$$

- We can estimate C and $Z_{0:T}$ via solving

$$\hat{C}_T, \hat{Z}_{0:T} = \operatorname{argmin}_{C, Z_{0:T}} \|X_{0:T} - CZ_{0:T}\|_F^2 \text{ subject to } C^\top C = I_d$$

- The solution can be found using SVD. Let $X_{0:T} = U\Sigma V^\top$, then

$$\hat{C}_T = U \quad \hat{Z}_{0:T} = \Sigma V^\top$$

- This solution is very close to learning a PPCA model for $Y_{0:T}$.

Approximate Solutions (A, Q, R)

$$\begin{aligned} X_{0:T} &= U\Sigma V^\top \\ \hat{Z}_{0:T} &= \Sigma V^\top \end{aligned}$$

- We can estimate A by the following

$$\hat{A}_T = \operatorname{argmin}_A \left\| \hat{Z}_{1:T} - A\hat{Z}_{0:T-1} \right\|_F = \hat{Z}_{1:T} \hat{Z}_{1:T}^\top (\hat{Z}_{0:T} \hat{Z}_{0:T}^\top)^{-1}$$

- We can estimate the state and output covariances via

$$\hat{Q}_T = \frac{1}{T} \sum_{t=0}^{T-1} \hat{w}_t \hat{w}_t^\top$$

$$\hat{R}_T = \frac{1}{T} \sum_{t=0}^{T-1} \hat{v}_t \hat{v}_t^\top$$

where $\hat{w}_t \doteq y_t - \hat{C}_T \hat{z}_t$ and $\hat{v}_t \doteq \hat{z}_{t+1} - \hat{A}_T \hat{z}_t$.

Approximate Solution: Pseudocode

- Therefore, everything can be computed in succession and in closed-form
- In the original work, the algorithm is implemented in fewer than 20 lines

```
function [x0,Ymean,Ahat,Bhat,Chat] = dytex(Y,n,nv)

% Suboptimal Learning of Dynamic Textures;
% (c) UCLA, March 2001.

tau = size(Y,2); Ymean = mean(Y,2);
[U,S,V] = svd(Y-Ymean*ones(1,tau),0);
Chat=U(:,1:n); Xhat = S(1:n,1:n)*V(:,1:n)';
x0=Xhat(:,1);
Ahat = Xhat(:,2:tau)*pinv(Xhat(:,1:(tau-1)));
Vhat = Xhat(:,2:tau)-Ahat*Xhat(:,1:(tau-1));
[Uv,Sv,Vv] = svd(Vhat,0);
Bhat = Uv(:,1:nv)*Sv(1:nv,1:nv)/sqrt(tau-1);

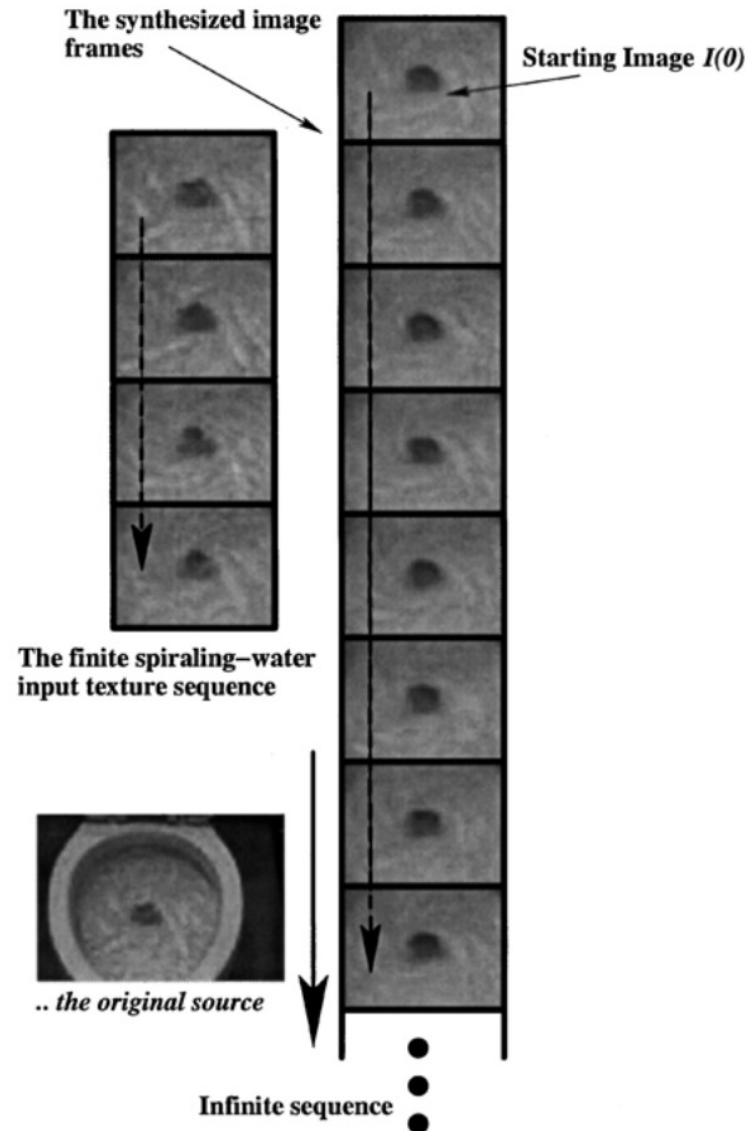

function [I] = synth(x0,Ymean,Ahat,Bhat,Chat,tau)

% Synthesis of Dynamic Textures;
% (c) UCLA, March 2001.

[n,nv] = size(Bhat);
X(:,1) = x0;
for t = 1:tau,
    X(:,t+1) = Ahat*X(:,t)+Bhat*randn(k,1);
    I(:,t) = Chat*X(:,t)+Ymean;
end;
```

Experimental Results

- By learning the parameters using a finite number of sequence. Our system can then help us synthesize *infinite sequences*

Experimental Results

- Top: The original sequence of water waves
- Left: As you increase the number of images in your original sequence, you are better at reconstructing the original sequence with your system
- Right: extrapolation error reduces as number of time steps increases

Figure 3. River. From top to bottom: Samples of the original sequence, corresponding samples of the compressed sequence (compression ratio: 2.53), samples of extrapolated sequence (using $n = 50$ components, $\tau = 120$, $m = 170 \times 115$), compression error as a function of the dimension of the state space n , and extrapolation error as a function of the length of the training set τ . The data set used comes from the *MIT Temporal Texture database*.

<https://www.youtube.com/watch?v=bXHpOodkUv0>

Appendix (Optional)

- In the subsequent slides, we derive EM for learning the parameters of LDSs.

Learning

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

- **Learning.** Given N observations $\{\mathbf{x}^{(n)}\}_{n=1}^N$, find best θ :

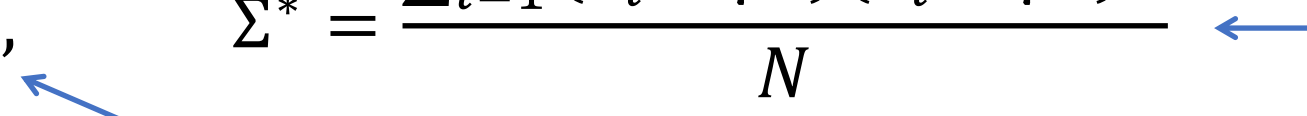

$$\max_{\theta} \prod_{n=1}^N p_{\theta}(\mathbf{x}^{(n)})$$

- **We can perform learning via the EM algorithm**
 - derivations are algebraically involved and are given at the end of the slides.

Learning (Review Lecture 2)

- The likelihood $\prod_{i=1}^N p_{\theta}(x_i) = \frac{\exp\left(-\frac{1}{2}\sum_{i=1}^N (x_i - \mu)^{\top} \Sigma^{-1} (x_i - \mu)\right)}{(2\pi)^{\frac{ND}{2}} \det(\Sigma)^{\frac{N}{2}}}$ is maximized at

$$\mu^* = \frac{\sum_{i=1}^N x_i}{N}, \quad \Sigma^* = \frac{\sum_{i=1}^N (x_i - \mu^*)(x_i - \mu^*)^{\top}}{N}$$

empirical mean empirical covariance

- How did we obtain μ^* and Σ^* ?
 - **Step 0:** Rewrite the objective
 - maximizing log-likelihood is minimizing $N \log \det \Sigma + \sum_{i=1}^N (x_i - \mu)^{\top} \Sigma^{-1} (x_i - \mu)$
 - **Step 1:** Set the derivative w.r.t. μ to 0
 - solving it gives μ^*
 - **Step 2:** Substitute $\mu = \mu^*$ into the objective, and set the derivative w.r.t. Σ^{-1} to 0

$m \cdot \log \det \Sigma + \text{tr}(S\Sigma^{-1})$ is minimized at $\Sigma = S/m$

Learning

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

- **Learning.** Given N observations $\{\mathbf{x}^{(n)}\}_{n=1}^N$, find best θ :
$$\max_{\theta} \prod_{n=1}^N p_{\theta}(\mathbf{x}^{(n)})$$
- We are going to apply the EM algorithm (iteration: k):

E-step:

$$q^k(\mathbf{z}|\mathbf{x}^{(n)}) = p_{\theta^k}(\mathbf{z}|\mathbf{x}^{(n)})$$

M-step:

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z}|\mathbf{x}^{(n)})} [\log p_{\theta}(\mathbf{x}^{(n)}, \mathbf{z})]$$

Guessing

Model Parameters:

- $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

E-step:

$$q^k(\mathbf{z}|\mathbf{x}^{(n)}) = p_{\theta^k}(\mathbf{z}|\mathbf{x}^{(n)})$$

M-step:

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z}|\mathbf{x}^{(n)})} [\log p_{\theta}(\mathbf{x}^{(n)}, \mathbf{z})]$$

$$\mathbb{P}(Z_0) = \mathcal{N}(\pi_0, \Sigma_0)$$

$$\mathbb{P}(Z_t|z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$$

$$\mathbb{P}(Y_t|z_t) = \mathcal{N}(Cz_t, R)$$

- Let us exercise our intuition and guess a solution to the M-step...

- Since $\pi_0 = \mathbb{E}[z_0]$, we guess... :

$$\pi_0^{k+1} = \sum_{n=1}^N \frac{\mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z}|\mathbf{x}^{(n)})} [z_0]}{N} \quad \leftarrow \text{“empirical mean”}$$

- And we guess the covariance should be

$$\Sigma_0^{k+1} = \sum_{n=1}^N \frac{\left(\mathbb{E}_{q^k(\mathbf{z}|\mathbf{x}^{(n)})} [z_0] - \pi_0^{k+1} \right) \left(\mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z}|\mathbf{x}^{(n)})} [z_0] - \pi_0^{k+1} \right)^{\top}}{N} \quad \leftarrow \text{“empirical covariance”}$$

- Try having a guess for $A^{k+1}, Q^{k+1}, C^{k+1}, R^{k+1}$ yourself...

E-step (iteration: k)

$$\hat{z}_{s|t} := \mathbb{E}[z_s | x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s | x_0, \dots, x_t)$$

E-step:

$$q^k(\mathbf{z} | \mathbf{x}^{(n)}) = p_{\theta^k}(\mathbf{z} | \mathbf{x}^{(n)})$$

M-step:

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})} [\log p_{\theta}(\mathbf{x}^{(n)}, \mathbf{z})]$$

- In E-step, we will need to compute the expectation $\mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})} [\cdot]$.
- “It turns out that” we only need to compute the following expectations:

$$\mathbb{E}_k^{(n)}[z_t] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t]$$
$$\mathbb{E}_k^{(n)}[z_t z_t^{\top}] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t z_t^{\top}]$$
$$\mathbb{E}_k^{(n)}[z_t z_{t-1}^{\top}] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t z_{t-1}^{\top}]$$

- later you will see why...

E-step (iteration: k)

$$\hat{z}_{s|t} := \mathbb{E}[z_s | x_0, \dots, x_t]$$
$$\hat{\Sigma}_{s|t} := \text{Cov}(z_s | x_0, \dots, x_t)$$

E-step:

$$q^k(\mathbf{z} | \mathbf{x}^{(n)}) = p_{\theta^k}(\mathbf{z} | \mathbf{x}^{(n)})$$

M-step:

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})} [\log p_{\theta}(\mathbf{x}^{(n)}, \mathbf{z})]$$

$$\mathbb{E}_k^{(n)}[z_t] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t]$$
$$\mathbb{E}_k^{(n)}[z_t z_t^{\top}] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t z_t^{\top}]$$
$$\mathbb{E}_k^{(n)}[z_t z_{t-1}^{\top}] := \mathbb{E}_{\mathbf{z} \sim q^k(\mathbf{z} | \mathbf{x}^{(n)})}[z_t z_{t-1}^{\top}]$$

- These expectations can all be computed via smoothing using θ^k and $\mathbf{x}^{(n)}$
 - To see this, dropping indices k, n for clarity, we have

$$\mathbb{E}[z_t | \mathbf{x}] = \mathbb{E}[z_t | x_0, \dots, x_T] = \hat{z}_{t|T}$$

$$\begin{aligned} \mathbb{E}[z_t z_t^{\top} | \mathbf{x}] &= \text{Cov}(z_t | x_0, \dots, x_T) + \mathbb{E}[z_t | x_0, \dots, x_T] \mathbb{E}[z_t^{\top} | x_0, \dots, x_T] \\ &= \hat{\Sigma}_{t|T} + \hat{z}_{t|T} \hat{z}_{t|T}^{\top} \end{aligned}$$

$$\mathbb{E}[z_t z_{t-1}^{\top} | \mathbf{x}] = \hat{\Sigma}_{t|T} L_{t-1}^{\top} + \hat{z}_{t|T} \hat{z}_{t-1|T}^{\top}$$

homework

$$L_{t-1} = \hat{\Sigma}_{t-1|t-1} A^{\top} \hat{\Sigma}_{t|t-1}^{-1}$$

M-step (iteration: k)

$$\begin{aligned}\mathbb{P}(Z_0) &= \mathcal{N}(\pi_0, \Sigma_0) \\ \mathbb{P}(Z_t|z_{t-1}) &= \mathcal{N}(Az_{t-1}, Q) \\ \mathbb{P}(X_t|z_t) &= \mathcal{N}(Cz_t, R)\end{aligned}$$

Model Parameters:
• $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\log p_{\theta}(x^{(n)}, z)]$$

- **Observation.** In the joint log-likelihood

$$p_{\theta}(x_0, \dots, x_T, z_0, \dots, z_T) = p_{\theta}(z_0) \prod_{t=0}^T p_{\theta}(x_t|z_t) \prod_{t=1}^T p_{\theta}(z_t|z_{t-1}),$$

- π_0, Σ_0 only appear in $p_{\theta}(z_0)$
- A, Q only appear in $\prod_{t=1}^T p_{\theta}(z_t|z_{t-1})$
- C, R only appear in $\prod_{t=0}^T p_{\theta}(x_t|z_t)$
- So the objective of the M-step is separable (as in HMMs), this gives ... (next page)

M-step (iteration: k)

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

$$\begin{aligned}\mathbb{P}(Z_0) &= \mathcal{N}(\pi_0, \Sigma_0) \\ \mathbb{P}(Z_t|z_{t-1}) &= \mathcal{N}(Az_{t-1}, Q) \\ \mathbb{P}(X_t|z_t) &= \mathcal{N}(Cz_t, R)\end{aligned}$$

Model Parameters:
• $\theta := (\pi_0, \Sigma_0, A, Q, C, R)$

$$\theta^{k+1} = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\log p_{\theta}(x^{(n)}, z)]$$

- We can therefore decompose M-step into 3 optimization problems (as in HMMs):

M-step (π_0, Σ_0) :

$$(\pi_0^{k+1}, \Sigma_0^{k+1}) = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\log p_{\theta}(z_0)]$$

M-step (C, R) :

$$(C^{k+1}, R^{k+1}) = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} \left[\sum_{t=0}^T \log p_{\theta}(x_t^{(n)} | z_t) \right]$$

M-step (A, Q) :

$$(A^{k+1}, Q^{k+1}) = \operatorname{argmax}_{\theta} \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\sum_{t=1}^T \log p_{\theta}(z_t | z_{t-1})]$$

- We will address them one by one next

M-step (π_0, Σ_0)

$$\mathbb{P}(Z_0) = \mathcal{N}(\pi_0, \Sigma_0)$$

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

- Since $p_\theta(z_0)$ is Gaussian, we have:

$$\log p_\theta(z_0) \propto -\log \det \Sigma_0 - (z_0 - \pi_0)^\top \Sigma_0^{-1} (z_0 - \pi_0)$$

- And now we get this:

$$(\pi_0^{k+1}, \Sigma_0^{k+1}) = \operatorname{argmax}_\theta \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\log p_\theta(z_0)]$$

$$(\pi_0^{k+1}, \Sigma_0^{k+1}) = \operatorname{argmin}_\theta N \log \det \Sigma_0 + \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [(z_0 - \pi_0)^\top \Sigma_0^{-1} (z_0 - \pi_0)]$$

M-step (π_0, Σ_0)

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

$$(\pi_0^{k+1}, \Sigma_0^{k+1}) = \operatorname{argmin}_{\theta} N \log \det \Sigma_0 + \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})}[(z_0 - \pi_0)^\top \Sigma_0^{-1} (z_0 - \pi_0)]$$

use the definitions of $\mathbb{E}_k^{(n)}[z_0]$ and $\mathbb{E}_k^{(n)}[z_0 z_0^\top]$

$$(\pi_0^{k+1}, \Sigma_0^{k+1}) = \operatorname{argmin}_{\theta} N \log \det \Sigma_0 + N \pi_0^\top \Sigma_0^{-1} \pi_0 + \sum_{n=1}^N \operatorname{tr} \left(\mathbb{E}_k^{(n)}[z_0 z_0^\top] \Sigma_0^{-1} \right) - 2 \sum_{n=1}^N \pi_0^\top \Sigma_0^{-1} \mathbb{E}_k^{(n)}[z_0]$$

- Setting the derivative with respect to π_0 to 0 yields $\pi_0^{k+1} = \frac{\sum_{n=1}^N \mathbb{E}_k^{(n)}[z_0]}{N}$

Use π_0^{k+1}

$$\Sigma_0^{k+1} = \operatorname{argmin}_{\theta} N \cdot \log \det \Sigma_0 + \sum_{n=1}^N \operatorname{tr} \left(\mathbb{E}_k^{(n)}[z_0 z_0^\top] \Sigma_0^{-1} \right) - N \cdot \operatorname{tr} \left(\pi_0^{k+1} (\pi_0^{k+1})^\top \Sigma_0^{-1} \right)$$

$m \cdot \log \det \Sigma + \operatorname{tr}(S \Sigma^{-1})$ is minimized at $\Sigma = S/m$

$$\Sigma_0^{k+1} = \frac{\sum_{n=1}^N \mathbb{E}_k^{(n)}[z_0 z_0^\top]}{N} - \pi_0^{k+1} (\pi_0^{k+1})^\top$$

M-step (C, R)

$$\mathbb{P}(X_t|z_t) = \mathcal{N}(Cz_t, R)$$

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

$$(C^{k+1}, R^{k+1}) = \operatorname{argmax}_\theta \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} \left[\sum_{t=0}^T \log p_\theta(x_t^{(n)} | z_t) \right]$$

$p_\theta(x_t^{(n)} | z_t)$ is Gaussian

$$(C^{k+1}, R^{k+1}) = \operatorname{argmin}_\theta N(T+1) \log \det R + \sum_{n=1}^N \sum_{t=0}^T \mathbb{E}_{z_t \sim q^k(z_t|x^{(n)})} \left[\left(x_t^{(n)} - Cz_t \right)^\top R^{-1} \left(x_t^{(n)} - Cz_t \right) \right]$$

use the definitions of $\mathbb{E}_k^{(n)}[z_t]$ and $\mathbb{E}_k^{(n)}[z_t z_t^\top]$

$$\min_\theta N(T+1) \log \det R + \sum_{n=1}^N \sum_{t=0}^T \left\{ \operatorname{tr} \left(\left(C \mathbb{E}_k^{(n)}[z_t z_t^\top] C^\top + x_t^{(n)} (x_t^{(n)})^\top \right) R^{-1} - 2x_t^{(n)} \mathbb{E}_k^{(n)}[z_t]^\top C^\top R^{-1} \right) \right\}$$

- Setting the derivative with respect to C to 0 yields

$$C^{k+1} = \left(\sum_{n=1}^N \sum_{t=0}^T x_t^{(n)} \mathbb{E}_k^{(n)}[z_t]^\top \right) \left(\sum_{n=1}^N \sum_{t=0}^T \mathbb{E}_k^{(n)}[z_t z_t^\top] \right)^{-1}$$

Use C^{k+1}

$$\min_\theta N(T+1) \log \det R + \sum_{n=1}^N \sum_{t=0}^T \left\{ \operatorname{tr} \left(x_t^{(n)} (x_t^{(n)})^\top R^{-1} - x_t^{(n)} \mathbb{E}_k^{(n)}[z_t]^\top (C^{k+1})^\top R^{-1} \right) \right\}$$

$$\begin{aligned}\frac{\partial \operatorname{tr}(C^\top X)}{\partial C} &= X \\ \frac{\partial \operatorname{tr}(C^\top X C Y)}{\partial C} &= X C Y + X^\top C Y^\top\end{aligned}$$

$m \cdot \log \det \Sigma + \operatorname{tr}(S \Sigma^{-1})$ is minimized at $\Sigma = S/m$

$$R^{k+1} = \frac{\sum_{n=1}^N \sum_{t=0}^T x_t^{(n)} (x_t^{(n)})^\top - C^{k+1} \sum_{n=1}^N \sum_{t=0}^T \mathbb{E}_k^{(n)}[z_t] (x_t^{(n)})^\top}{N(T+1)}$$

M-step (A, Q)

$$\mathbb{P}(Z_t|z_{t-1}) = \mathcal{N}(Az_{t-1}, Q)$$

$$\begin{aligned}\mathbb{E}_k^{(n)}[z_t] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t] \\ \mathbb{E}_k^{(n)}[z_t z_t^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_t^\top] \\ \mathbb{E}_k^{(n)}[z_t z_{t-1}^\top] &:= \mathbb{E}_{z \sim q^k(z|x^{(n)})}[z_t z_{t-1}^\top]\end{aligned}$$

$$(A^{k+1}, Q^{k+1}) = \operatorname{argmax}_\theta \sum_{n=1}^N \mathbb{E}_{z \sim q^k(z|x^{(n)})} [\sum_{t=1}^T \log p_\theta(z_t|z_{t-1})]$$

\downarrow $p_\theta(z_t|z_{t-1})$ is Gaussian
